## Chapter 6 - Lecture Worksheet 1 - Answers

A. A sample of solid aluminum is heated with an electrical coil. If $\mathbf{1 8 6}$ Joules of energy are added to a 11.8 gram sample initially at $21.0^{\circ} \mathrm{C}$, what is the final temperature of the aluminum ?

$$
\begin{gathered}
\begin{array}{|c|c|}
\hline \mathrm{q} & 186 \mathrm{~J} \\
\hline \mathrm{~m} & 11.8 \mathrm{~g} \\
\hline \mathrm{C}_{\mathrm{s}} & 0.90 \mathrm{~J} / \mathrm{g}^{0} \\
\hline \mathrm{~T}_{2} & ? \\
\hline \mathrm{~T}_{1} & 21.0^{\circ} \mathrm{C} \\
\hline \Delta \mathrm{~T} & ? \\
\hline \Delta T=\frac{q}{m C_{s}}=\frac{186 \mathrm{~J}}{(11.8 g)\left(0.90 \mathrm{~J} / \mathrm{g}^{\circ}\right)}=\mathbf{1 7 . 5}{ }^{0}=\mathrm{T}_{2}-\mathrm{T}_{1} \\
\mathrm{~T}_{2}=(\mathbf{1 7 . 5}+\mathbf{2 1 . 0})^{\mathbf{0}} \mathrm{C}=\mathbf{3 8 . 5} \mathbf{5}^{0} \mathrm{C}
\end{array} \\
\end{gathered}
$$

B. In the laboratory a student uses a "coffee cup" calorimeter to determine the specific heat of a metal.

She heats 19.0 grams of silver to $99.32^{\circ} \mathrm{C}$ and then drops it into a cup containing 78.6 grams of water at $21.14^{\circ} \mathrm{C}$. She measures the final temperature to be $22.24^{\circ} \mathrm{C}$. Assuming that all of the heat is transferred to the water, she calculates the specific heat of silver to be $\qquad$ $\mathrm{J} / \mathrm{g}^{0} \mathrm{C}$.

$$
\begin{array}{llllll}
\text { (1) } 0.204 & \text { (2) }-0.0144 & \text { (3) }-0.247 & \text { (4) }+0.247 & \text { (5) } 0.0144 & \text { (6) }-0.204
\end{array}
$$

Table your data:

|  | Water | Silver |
| :--- | :---: | :---: |
| m | 78.6 g | 19.0 g |
| $\mathrm{C}_{\mathrm{sp}}$ | $4.184 \mathrm{~J} / \mathrm{g}^{0}$ | $?$ |
| $\mathrm{~T}_{2}$ | $22.24{ }^{\circ} \mathrm{C}$ | $22.24{ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{1}$ | $21.14^{\circ} \mathrm{C}$ | $99.32{ }^{\circ} \mathrm{C}$ |
| $\Delta \mathrm{T}$ | $1.10{ }^{\circ} \mathrm{C}$ | $-77.08^{\circ} \mathrm{C}$ |

$-\mathrm{q}_{\mathrm{Ag}}=\mathrm{q}_{\mathrm{H} 2 \mathrm{O}}+\mathrm{q}_{\text {calorimeter }} \approx \mathrm{q}_{\mathrm{H} 2 \mathrm{O}}$ (assume all heat transferred to water)
$\mathrm{q}_{\mathrm{H} 2 \mathrm{O}}=\mathrm{m}_{\mathrm{H} 2 \mathrm{O}} \operatorname{Csp}\left(\mathrm{H}_{2} \mathrm{O}\right) \Delta \mathrm{T}_{\mathrm{H} 2 \mathrm{O}}=(78.6 \mathrm{~g})\left(4.184 \mathrm{~J} / \mathrm{g}^{0}\right)\left(1.10^{0} \mathrm{C}\right)=361.75 \mathrm{~J}$
$\mathrm{q}_{\mathrm{Ag}}=-\mathrm{q}_{\mathrm{H} 2 \mathrm{O}}=-361.75 \mathrm{~J}=\mathrm{m}_{\mathrm{Ag}} \operatorname{Csp}(\mathrm{Ag}) \Delta \mathrm{T}_{\mathrm{Ag}}$
Solve for specific heat of silver:
$\operatorname{Csp}(\mathrm{Ag})={ }_{-\mathrm{q}_{\mathrm{H} 2 \mathrm{O}}} /\left(\mathrm{m}_{\mathrm{Ag}} \Delta \mathrm{T}_{\mathrm{Ag}}\right)=(-361.75 \mathrm{~J}) /(19.0 \mathrm{~g})\left(-77.08^{\circ} \mathrm{C}\right)=+0.247 \mathrm{~J} / \mathrm{g}^{0}$
C. In the General Mills laboratory a nutritionist measured the calorie content of the newest taste sensation, blue cheese pizza. She found that when a 0.567 g sample of homogenized freeze-dried pizza was burned in a bomb calorimeter the temperature increased from $22.73^{\circ} \mathrm{C}$ to $27.35^{\circ} \mathrm{C}$. The calorimeter contained 525.4 g water. The heat capacity of the calorimeter was found in a separate experiment to be $377.3 \mathrm{~J} /{ }^{0} \mathrm{C}$. Calculate the number of food calories (kcal) per slice of pizza where one slice weighs 117 grams.
(1) 2.84 (2) 5.02
