## Eggs \& Molecules

## look for the parallels

It's Saturday morning, and a farmer in Ashfield has just returned from the chicken coop with 150 eggs that she'll sell at the Amherst Farmers' Market. If she sells eggs by the dozen at $\$ 3 /$ dozen, what is the maximum she will earn from eggs sales for the day?

$$
\left(150 \text { eggs) } \frac{1 \text { dozen }}{12 \text { eggs }}=12.5\right. \text { dozen }
$$

there are 12 individual eggs in a dozen eggs

Next convert to dollars
( 12.5 dozen) $\frac{\$ 3}{\text { dozen }}=\$ 37.50$
the in-class question was harder in that you needed to round off to the nearest dozen, before converting to dollars

What is the mass of C in 1 mole of $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$ ?
(1 mól $\left.\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}\right) \frac{9 \mathrm{~mol} \mathrm{C}}{1 \mathrm{~mol} \mathrm{C}} \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4} \quad=9 \mathrm{~mol} \mathrm{C}$
there are 9 C atoms in $1 \mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$ molecule there are 9 moles C in 1 mole $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$

Next convert to grams

$$
(9 \mathrm{~mol} \mathrm{C}) \frac{12.01 \mathrm{~g} \mathrm{C}}{1 \mathrm{~mol} \mathrm{C}}=108.1 \mathrm{~g} \mathrm{C}
$$
