# In the beginning...

# In the beginning...

# Chicken & Egg?

# RNA can do everything

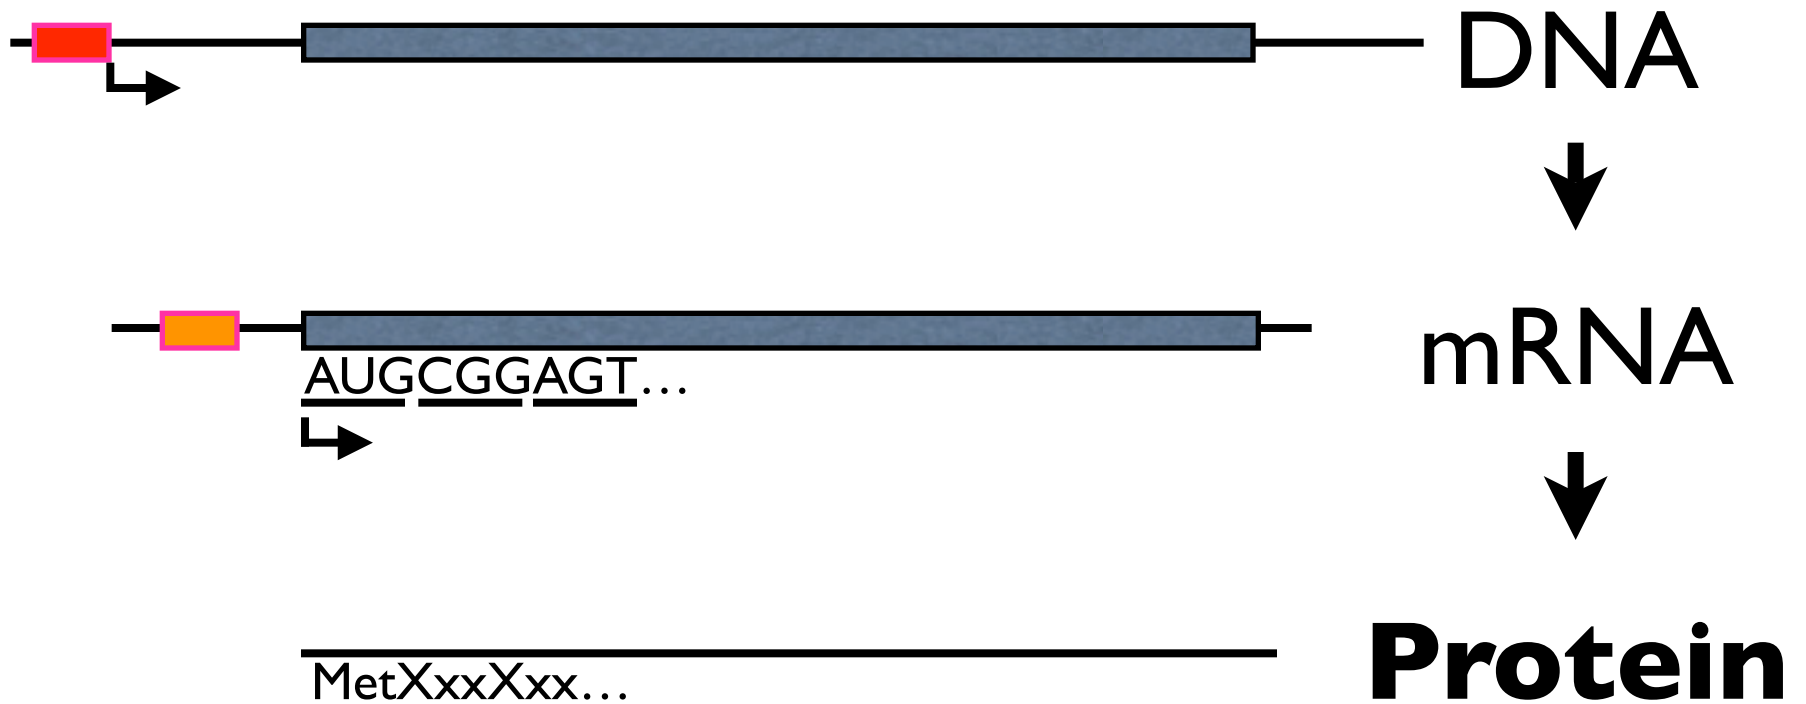

# RNA - primordial molecule

So we accepted that RNA was probably the first, primitive do-everything biomolecule.

But **proteins** came along to supplant everything and make the world, evolutionarily, what it is today. All hail the protein!

# Project Encode (2007)

(More) rewriting of textbooks

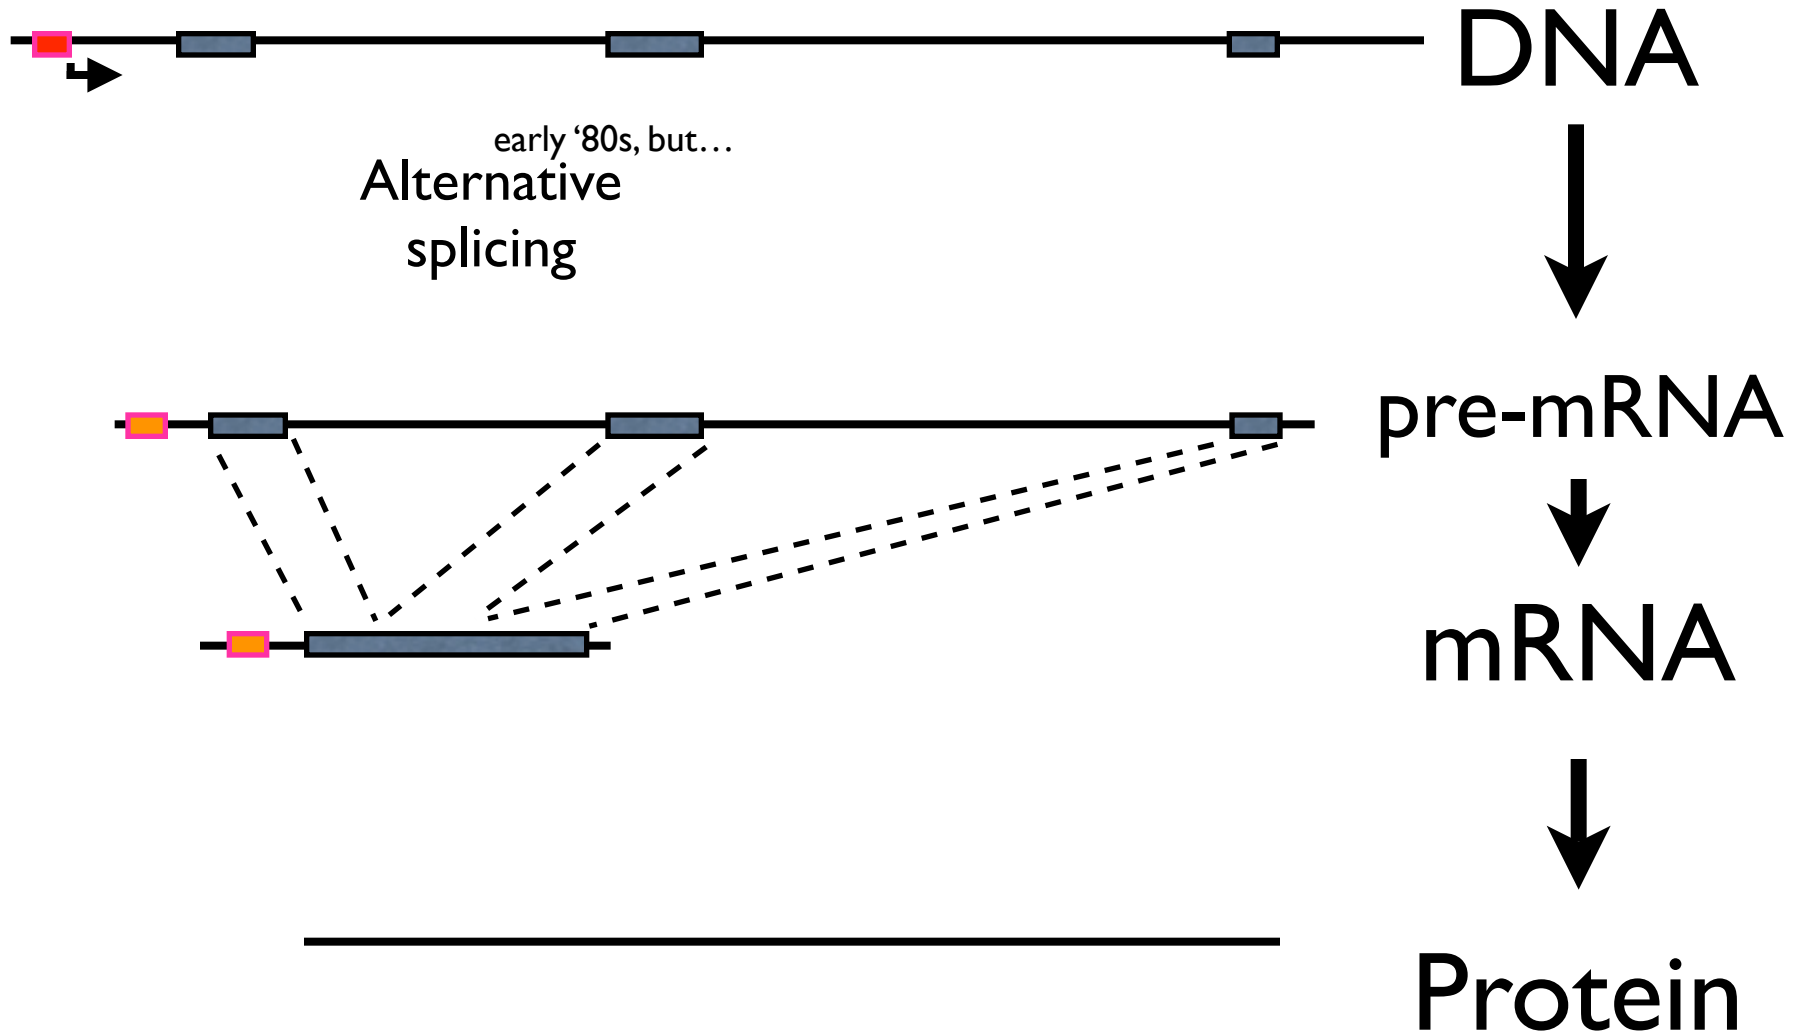

June 2007, published in Nature

- ★ Some regions of DNA far from protein-coding genes (extreme “junk?”) are nevertheless highly conserved
- ★ Most of both strands of the DNA is transcribed (far beyond that required for protein-coding genes)

## Replication by human DNA polymerase- $\epsilon$ occurs by Hoogsteen base-pairing

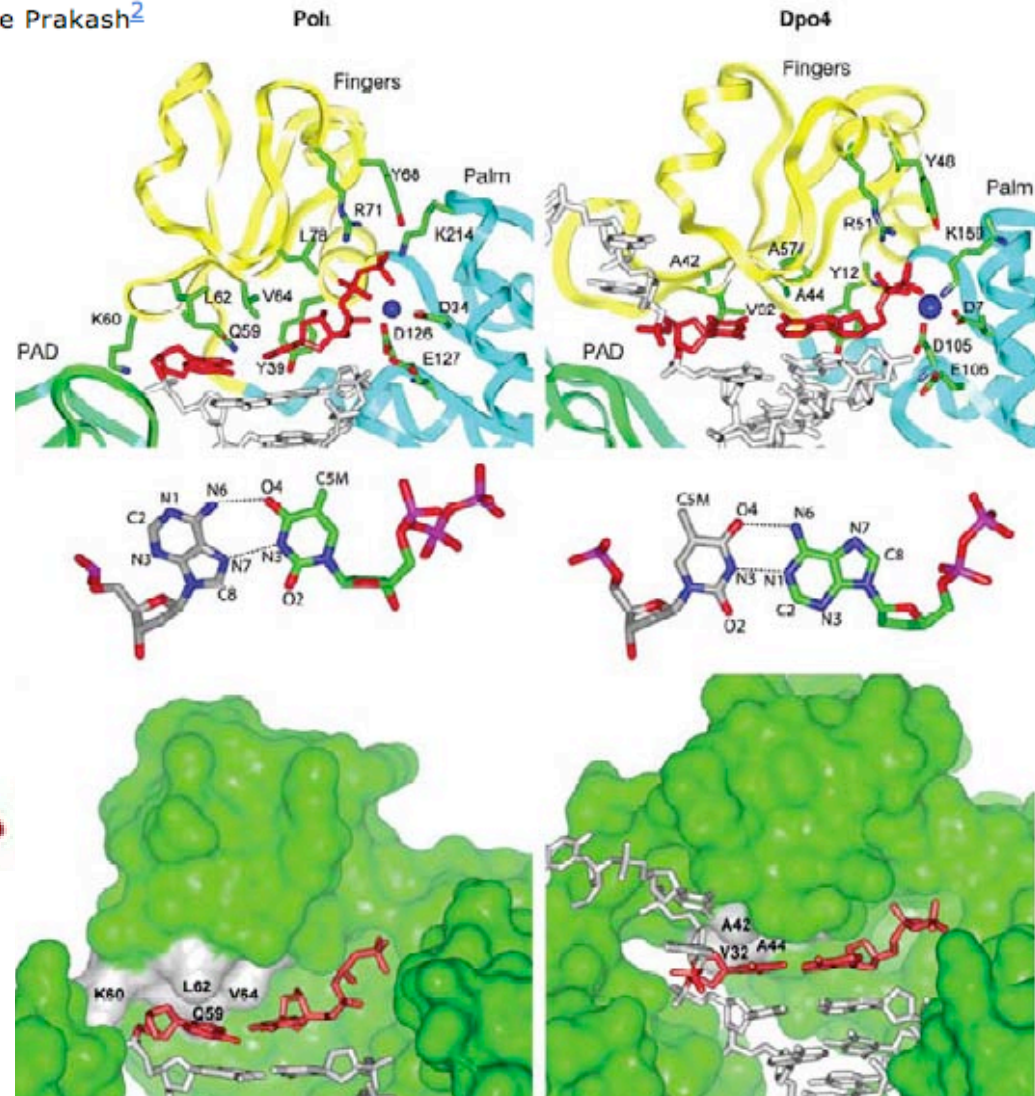

Deepak T. Nair<sup>1</sup>, Robert E. Johnson<sup>2</sup>, Satya Prakash<sup>2</sup>, Louise Prakash<sup>2</sup>  
and Aneel K. Aggarwal<sup>1</sup>

A crystal structure from from July 2004 shows that an error correcting (and error-prone) DNA polymerase uses Hoogsteen-WC base pairing to recognize the incoming substrate dNTP.

This supports biochemical studies that had been suggesting such a pairing.

This polymerase is good at bypassing lesions in the DNA (eg, damaged Watson-Crick face of G).

## Hoogsteen vindicated

Minor groove depth =  $2.8\text{\AA}$   
Major groove depth =  $13.5\text{\AA}$

# Compare

A-form (RNA)

Minor groove width =  $11\text{\AA}$   
Major groove width =  $2.7\text{\AA}$

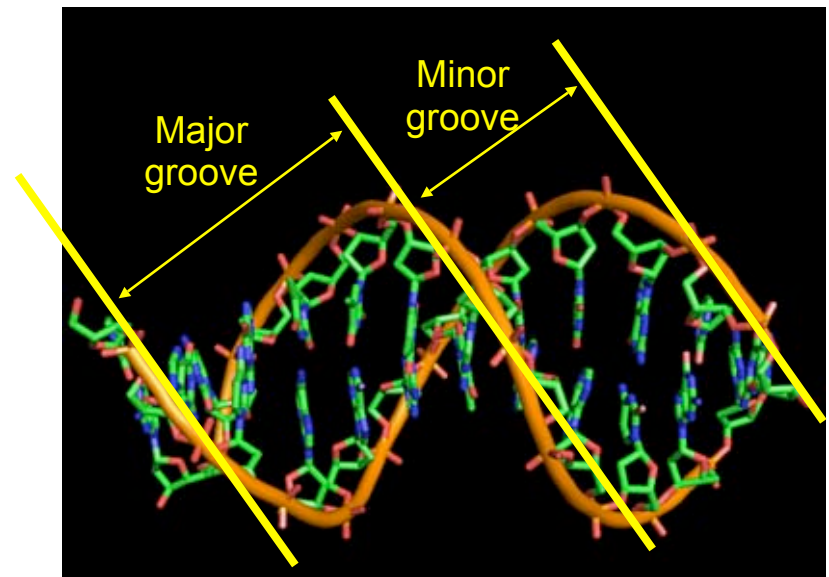

Minor groove depth =  $2.8\text{\AA}$   
Major groove depth =  $13.5\text{\AA}$

B-form (DNA)

Minor groove width =  $5.7\text{\AA}$   
Major groove width =  $11.7\text{\AA}$

Minor groove depth =  $7.5\text{\AA}$   
Major groove depth =  $8.8\text{\AA}$

# Z-DNA

Residues per turn = 12

Twist per base pair =  $-9^\circ$  /  $-51^\circ$

Rise per pair =  $3.7\text{\AA}$

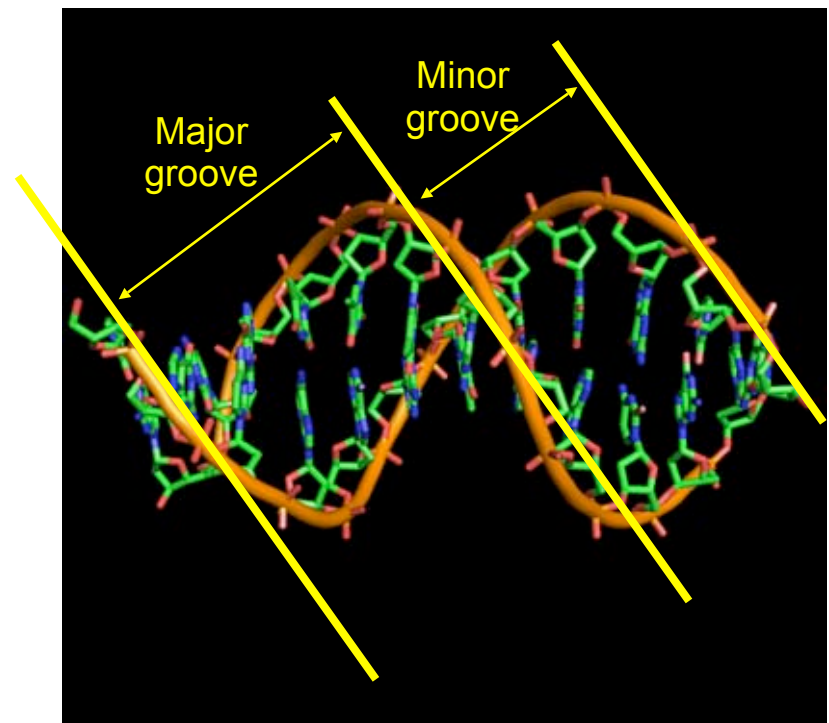

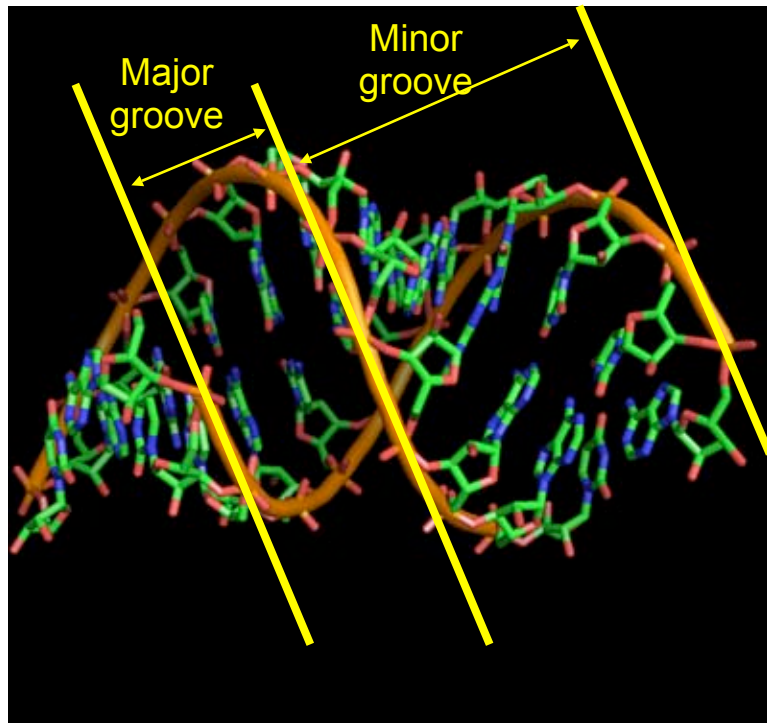

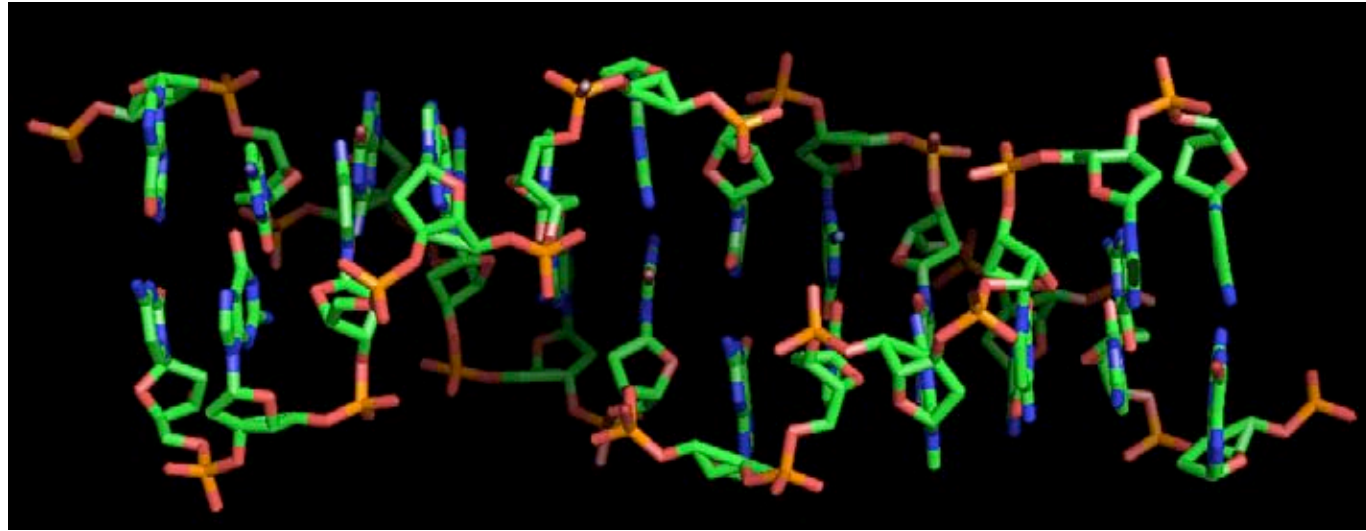

c3'-endo(syn) / c2'-endo

Minor groove width =  $2.0\text{\AA}$

Major groove width =  $8.8\text{\AA}$

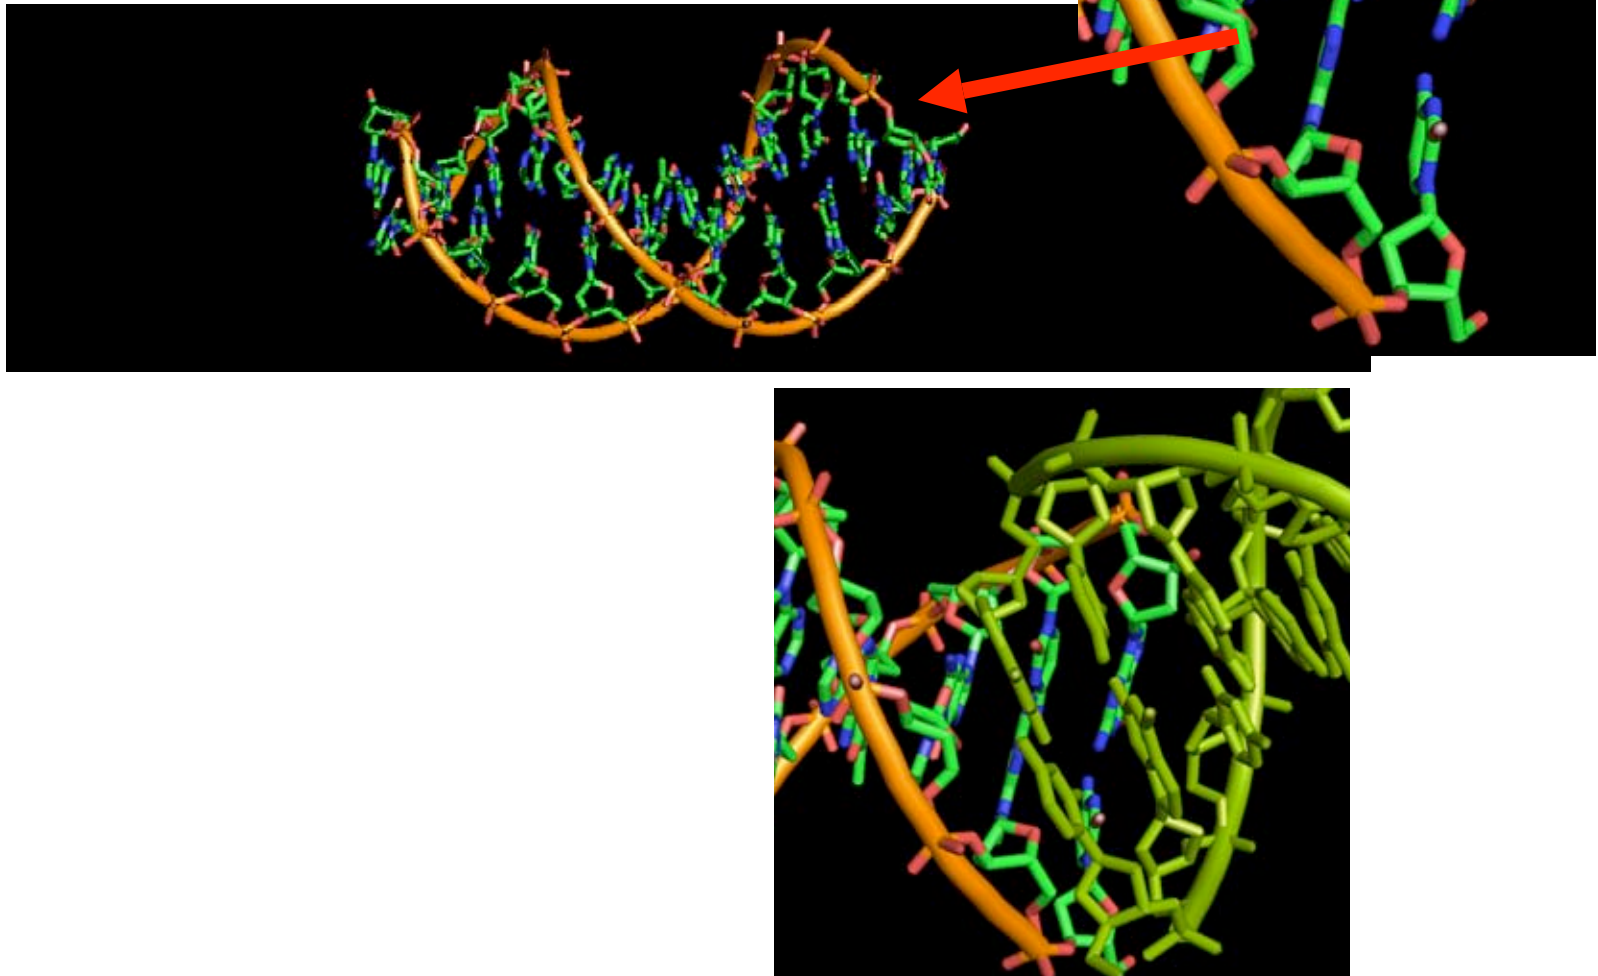

Minor groove depth =  $13.8\text{\AA}$

Major groove depth =  $3.7\text{\AA}$
