## Chem 111

10:10a section

## Final Exam

This exam is composed of 50 questions. Go initially through the exam and answer the questions you can answer quickly. Then go back and try the ones that are more challenging to you and/or that require calculations. Periodic table, solubility rules, and valuable constants are on the last page of the exam. Feel free to tear it off.

As discussed on the course syllabus, honesty and integrity are absolute essentials for this class. In fairness to others, dishonest behavior will be dealt with to the full extent of University regulations.

1. The average molecular speed in a sample of $\mathrm{N}_{2}$ gas is $478 \mathrm{~m} / \mathrm{s}$ at 303 K .

The average molecular speed in a sample of $\mathrm{CO}_{2}$ gas at the same temperature is:

1) $304 \mathrm{~m} \mathrm{~s}^{-1}$
2) $381 \mathrm{~m} \mathrm{~s}^{-1}$
3) $478 \mathrm{~m} \mathrm{~s}^{-1}$
4) $326 \mathrm{~m} \mathrm{~s}^{-1}$
5) $600 \mathrm{~m} \mathrm{~s}^{-1}$
(2) Same temperature means same kinetic energy, so
(OWL 12-6d)

$$
\begin{aligned}
& K E=\frac{1}{2} m_{N_{2}} u_{N_{2}}^{2}=\frac{1}{2} m_{\mathrm{CO}_{2}} u_{\mathrm{CO}_{2}}^{2} \\
& u_{\mathrm{CO}_{2}}^{2}=\frac{m_{N_{2}}}{m_{\mathrm{CO}_{2}}} u_{N_{2}}^{2}=\frac{\left(2 \times 14.01 \mathrm{~g} \mathrm{~mol}^{-1}\right)}{\left(12.01 \mathrm{~g} \mathrm{~mol}^{-1}\right)+\left(2 \times 16.00 \mathrm{~g} \mathrm{~mol}^{-1}\right)}\left(478 \mathrm{~m} \mathrm{~s}^{-1}\right)^{2} \\
& =145500\left(\mathrm{~m} \mathrm{~s}^{-1}\right)^{2}=\left(381 \mathrm{~m} \mathrm{~s}^{-1}\right)^{2}
\end{aligned}
$$

2. A 1.28 mol sample of Ar gas is confined in a 31.5 liter container at $26.5^{\circ} \mathrm{C}$. If 1.28 mol of $\mathrm{F}_{2}$ gas is added while doubling the volume and keeping the temperature constant, the average kinetic energy per molecule will:
1) decrease
2) remain the same
3) increase
4) not enough information
5) I don't have a clue
(2) Temperature determines average kinetic energy

Chapter 12
3. A sample of $\mathrm{Cl}_{2}$ gas is confined in a 2.0 liter container at $50^{\circ} \mathrm{C}$. Then 2.5 mol of He is added, holding both the volume and temperature constant. The pressure will increase because:

1) As the number of molecule-wall collisions increases, the force per collision increases.
2) With more molecules per unit volume, the molecules hit the walls of the container more often.
3) With more molecules in the container, the molecules have higher average speeds.
4) With higher average speeds, on average the molecules hit the walls of the container with more force.
5) None of the Above
4. A 1.96 mol sample of $\mathrm{CO}_{2}$ gas is confined in a 49.1 liter container at $32.3^{\circ} \mathrm{C}$. If the temperature of the gas sample is increased to $55.0^{\circ} \mathrm{C}$, holding the volume constant, the pressure will increase because:
1) With higher average speeds, on average the molecules hit the walls of the container with more force.
2) With lower average speeds, the molecules hit the walls of the container less often.
3) As the average speed increases, the number of molecule-wall collisions decreases.
4) None of the above

## Chapter 12

5. In our bodies, sugar is broken down with oxygen to produce water and carbon dioxide. How many moles of glucose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}\right)$ are required to react completely with 42.8 L of oxygen gas $\left(\mathrm{O}_{2}\right)$ according to the following reaction at $0{ }^{\circ} \mathrm{C}$ and 1 atm pressure? Note that the reaction may need balancing.

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

1) 6.0 mol
2) 0.250 mol
3) 0.319 mol
4) 0.637 mol
5) 7.13 mol
(3) First, balance the reaction:

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{~s})+6 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 6 \mathrm{CO}_{2}(\mathrm{~g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

6 mol of oxygen reacts with 1 mol of glucose, so first find the the number of moles of $\mathrm{O}_{2}$ gas: $n=\frac{P V}{R T}=\frac{(1 \mathrm{~atm})(42.8 \mathrm{~L})}{\left(0.0820{\left.\mathrm{~atm} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)(273 \mathrm{~K})}^{2}\right.}=1.91 \mathrm{~mol}$

Therefore, we need $\left(\frac{1}{6}\right) 1.91 \mathrm{~mol}=0.319 \mathrm{~mol}$
OWL 12-3b
6. What is the total volume of gaseous products formed when 190 L of bromine trifluoride $\left(\mathrm{BrF}_{3}\right)$ react completely to form $\mathrm{Br}_{2}$ and $\mathrm{F}_{2}$ ? (All gases are at the same temperature and pressure, before and after.)

1) 85 L
2) 190 L
3) 380 L
4) 320 L
5) 160 L
(3) First, write a balanced equation:

$$
2 \mathrm{BrF}_{3}->\mathrm{Br}_{2}+3 \mathrm{~F}_{2}
$$

Look at mole ratios. 4 moles of gases are derived from 2 moles of reactants.
Therefore, the volume should double.

2) 97 mol
3) 54 mol
4) 0.13 mol
5) 1.2 mol
$n=\frac{P V}{R T}=\frac{(8.0 \mathrm{~mm})\left(10.0 \mathrm{~m}^{3}\right)}{\left(0.0820 \mathrm{~atm} L K^{-1} \mathrm{~mol}^{-1}\right)(27+273) K}\left(\frac{\mathrm{~atm}}{760 \mathrm{~mm}}\right)\left(\frac{100 \mathrm{~cm}}{\mathrm{~m}}\right)^{3}\left(\frac{L}{1000 \mathrm{~cm}^{3}}\right)$

(2) This question is intended to get you thinking about concepts we will need in the next chapter. The key here is BOTH ionic and covalent. 3) $\mathrm{Co}_{2} \mathrm{O}_{3}$
4) $\mathrm{Co}_{3} \mathrm{O}_{2}$
5) $\mathrm{CoO}_{2}$
(3) $\mathrm{Co}_{2} \mathrm{O}_{3} \rightarrow 2 \mathrm{Co}^{3+}+3 \mathrm{O}^{2-}$

46. What is the molar mass of nitrogen dioxide?
1) $62 \mathrm{~g} / \mathrm{mol}$
2) $32 \mathrm{~g} / \mathrm{mol}$
3) $44 \mathrm{~g} / \mathrm{mol}$
4) $16 \mathrm{~g} / \mathrm{mol}$
5) $46 \mathrm{~g} / \mathrm{mol}$
(5) $\mathrm{NO}_{2}$

$$
1\left(14.0067 \frac{\mathrm{~g}}{\mathrm{~mol}}\right)+2\left(16.00 \frac{\mathrm{~g}}{\mathrm{~mol}}\right)=46.0 \frac{\mathrm{~g}}{\mathrm{~mol}}
$$

(OWL, Chapt 3)
47. A sample of citric acid, $\mathbf{C}_{\mathbf{6}} \mathbf{H}_{\mathbf{8}} \mathbf{O}_{\mathbf{7}}$, contains 0.153 mol of the compound. What is the mass of this sample, in grams?

1) 3.02 g
2) 13.7 g
3) 29.4 g
4) 0.0730 g
5) 20.2 g

First we need the molar mass of citric acid:

$$
\begin{aligned}
& 6(\text { molar mass of } \mathrm{C})+8(\text { molar mass of } \mathrm{H})+7(\text { molar mass of } \mathrm{O})= \\
& 6\left(12.011 \frac{\mathrm{~g}}{\mathrm{~mol}}\right)+8\left(1.0079 \frac{\mathrm{~g}}{\mathrm{~mol}}\right)+7\left(15.9994 \frac{\mathrm{~g}}{\mathrm{~mol}}\right)=192.12 \frac{\mathrm{~g}}{\mathrm{~mol}}
\end{aligned}
$$

Use that to calculate the mass:

$$
\begin{equation*}
(0.153 \mathrm{~mol})\left(\frac{192.12 g}{m o l}\right)=29.4 g \tag{3}
\end{equation*}
$$

(OWL question, Chapt 3)
48. What is the (mass) percent composition of $\mathbf{H}$ in citric acid, $\mathbf{C}_{\mathbf{6}} \mathbf{H}_{\mathbf{8}} \mathbf{O}_{\mathbf{7}}$ ?

1) $6.87 \%$
2) $4.20 \%$
3) $38.1 \%$
4) $30.6 \%$
5) $6.00 \%$
(2) Mass of H in 1 mol of the compound: $(8 \mathrm{~mol})(1.008 \mathrm{~g} / \mathrm{mol})=8.06 \mathrm{~g}$

Mass of 1 mol of the compound: 192.12 g (see above)
Percent composition: $\frac{8.06 g \mathrm{C}}{192 g} 100 \%=4.20 \%$
(OWL question, Chapt 3)

1) 901 g
2) 90.1 g
3) 111 g
4) 1110 g
5) 1000 g
(4) $1000 m L\left(\frac{1 \mathrm{~cm}^{3}}{1 \mathrm{~mL}}\right)\left(\frac{1.11 \mathrm{~g}}{\mathrm{~cm}^{3}}\right)=1110 \mathrm{~g}$
(book question, Chapt 2)
50. The correct designator for this course is:
1) Econ 3.33
2) Chem 363
3) Chem 111
4) Sports 1
5) SOM 555
(3)

$$
\begin{array}{lll}
